

PHASE 5 – PROJECT DEVELOPMENT

1. INTRODUCTION

The Project Development phase involves the actual implementation of the **Import Data using Transform Maps (Spreadsheet)** project in the ServiceNow environment. The development process includes creating a custom Employee Test table, adding the required fields, preparing employee data in a spreadsheet, and creating an Import Set table for loading the spreadsheet data.

A Transform Map is then configured to transfer the data from the Import Set table to the Employee Test table. The source and target fields are mapped accordingly, and the transformation is executed to create the employee records in the target table. The imported records are then verified to ensure that the data has been transferred correctly.

2. EMPLOYEE TEST TABLE CREATION

A custom table is created in ServiceNow through:

Navigation:

System Definition → Tables → New

The following details are entered:

Field	Value
Label	Employee Test
Name	u_employee_test

The Employee Test table is used as the target table for storing the employee records imported from the spreadsheet.

3. EMPLOYEE TEST TABLE FIELD CREATION

After creating the Employee Test table, the required fields are added using the Form Layout option.

The following fields are created:

Field	Type
Employee ID	String
Employee Name	String
Email	String
Department	String
Location	String

These fields are used to store the employee information after the transformation process is completed.

4. SAMPLE SPREADSHEET PREPARATION

A sample spreadsheet is prepared using Google Spreadsheet with employee information. The spreadsheet contains the required employee details such as Employee ID, Name, Email, Department, and Location.

The sample data used for the project is given below:

Employee ID	Name	Email	Department	Location
SB0001	User1	user1@gmail.com	Servicenow	Tamil Nadu
SB0002	User2	user2@gmail.com	Servicenow	Tamil Nadu
SB0003	User3	user3@gmail.com	Servicenow	Tamil Nadu
SB0004	User4	user4@gmail.com	Servicenow	Tamil Nadu
SB0005	User5	user5@gmail.com	Servicenow	Tamil Nadu

The spreadsheet is downloaded in **Excel (.xlsx)** format for importing into ServiceNow.

5. IMPORT SET TABLE CREATION

The spreadsheet data is loaded into ServiceNow through the Import Set functionality.

Navigation:

Application Navigator → Load Data

The following details are provided:

Label	Employee Import
Name	u_employee_import

The Employee Import table acts as a staging table where the spreadsheet data is loaded before it is transformed into the target Employee Test table.

After submitting the data, the Import Set table is created successfully.

6. TRANSFORM MAP CREATION

A Transform Map is created to transfer the employee data from the Employee Import table to the Employee Test table.

The following details are configured:

- **Name:** Sample Spreadsheet Import
- **Source Table:** Employee Import
- **Target Table:** Employee Test

The **Auto Map Matching Fields** option is used to identify the matching source and target fields.

7. FIELD MAPPING

The source fields from the Employee Import table are mapped with their corresponding fields in the Employee Test table.

The following field mappings are configured:

Source Field	Target Field
Employee ID	Employee ID
Name	Employee Name
Email	Email
Department	Department
Location	Location

The Mapping Assist option is used to configure the required field mappings. After completing the mapping, the Transform Map is saved.

8. DATA TRANSFORMATION

After creating and saving the Transform Map, the imported spreadsheet data is transformed into the Employee Test table.

The **Transform** option is selected and the transformation process is executed. ServiceNow processes the records from the Employee Import table and creates the corresponding employee records in the Employee Test table.

After the transformation is completed, a success message is displayed.

9. DATA VALIDATION

After the transformation is completed, the Employee Test table is opened to verify the imported records. The imported employee details are checked to ensure that the values from the spreadsheet have been transferred correctly.

The following fields are verified:

- Employee ID
- Employee Name
- Email

- Department
- Location

The fields can be rearranged using the **Personalize List Columns** option for easier verification.

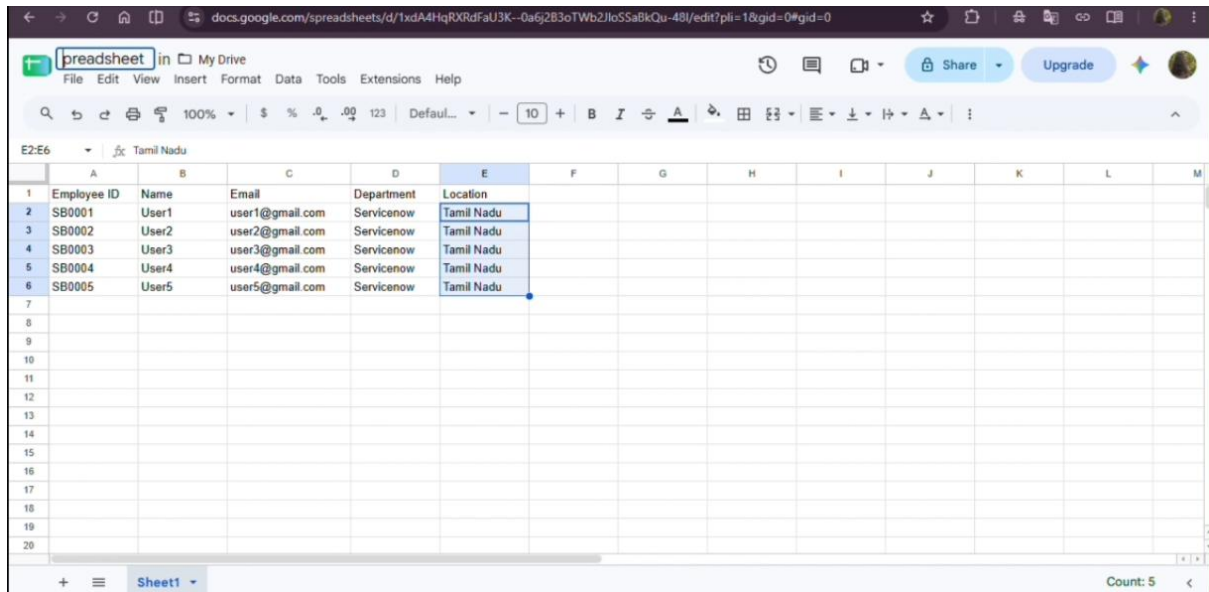

10. COALESCE CONFIGURATION

- Coalesce is configured in the Transform Map to avoid creating duplicate records when existing employee data is imported again.
- The **Employee ID** field is selected as the Coalesce field. When an Employee ID already exists in the target table, ServiceNow identifies the existing record instead of creating a duplicate record.
- If the employee details are changed and the same Employee ID is imported again, the existing record can be updated with the new values.

11. NEW DATA IMPORT AND VERIFICATION

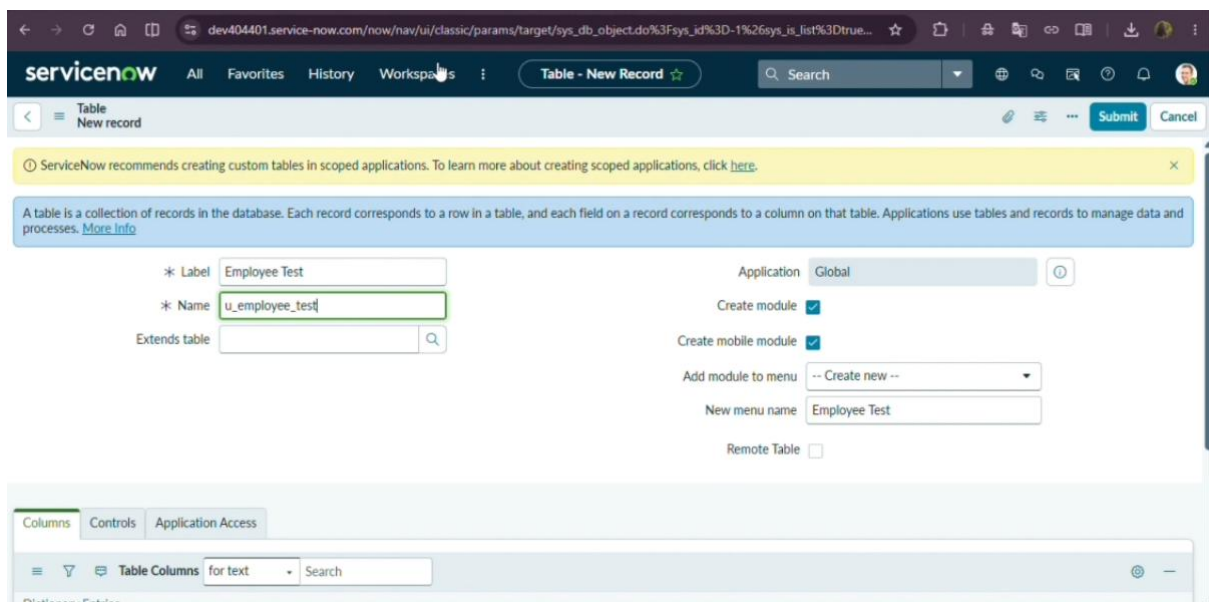

- A new spreadsheet containing existing and new employee records can be imported into the existing Employee Import table.
- The previously created **Sample Spreadsheet Import** Transform Map is selected and the transformation is executed.
- The Transform History is checked to verify the result of the transformation. The records can be identified based on their transformation status, such as inserted, updated, or ignored.
- This process verifies that the Transform Map and Coalesce configuration work correctly when employee data is imported multiple times.

12. SCREENSHOTS

Employee ID	Name	Email	Department	Location
SB0001	User1	user1@gmail.com	Servicenow	Tamil Nadu
SB0002	User2	user2@gmail.com	Servicenow	Tamil Nadu
SB0003	User3	user3@gmail.com	Servicenow	Tamil Nadu
SB0004	User4	user4@gmail.com	Servicenow	Tamil Nadu
SB0005	User5	user5@gmail.com	Servicenow	Tamil Nadu

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More info](#)

13. DEVELOPMENT OUTCOME

At the end of the development phase, the ServiceNow environment contains:

- Employee Test custom table.
- Required employee fields.
- Employee Import staging table.
- Prepared employee spreadsheet data.
- Configured Transform Map.
- Source and target field mappings.
- Successfully transformed employee records.
- Coalesce configuration to avoid duplicate records.
- Verified imported and updated employee data.

The completed configuration is then ready for detailed **Project Testing** in the next phase.
