

PHASE 6 – PROJECT TESTING

1. INTRODUCTION

The Project Testing phase is used to verify whether the **Import Data using Transform Maps (Spreadsheet)** project works according to the project requirements. Testing is performed by importing employee data from a spreadsheet into the Import Set table, transforming the data using the configured Transform Map, and checking the records in the Employee Test table. The testing also verifies the Coalesce configuration to ensure that duplicate records are not created when existing employee data is imported again.

2. TESTING OBJECTIVES

The main objectives are:

- Verify that spreadsheet data is loaded successfully into the Import Set table.
- Verify that the Transform Map transfers data to the Employee Test table.
- Verify that all source and target fields are mapped correctly.
- Verify that employee records are created successfully.
- Verify that existing records are updated when the same Employee ID is imported with changed details.
- Verify that duplicate records are not created using Coalesce.
- Verify that unchanged records are ignored when the same data is imported again.
- Verify the final imported records in the Employee Test table

3. TEST CASES

Test Case	Action	Expected Result
TC01	Upload employee spreadsheet	Spreadsheet data should be loaded successfully into the Import Set table
TC02	Run Transform Map	Employee records should be transferred to the Employee Test table
TC03	Check field mapping	Source values should appear in the correct target fields
TC04	Import a new Employee ID	A new employee record should be created
TC05	Import an existing Employee ID with changed details	The existing record should be updated
TC06	Import the same unchanged data again	Duplicate records should not be created and unchanged records should be ignored

4. IMPORT SET TABLE TESTING

The prepared Excel spreadsheet containing employee data is uploaded through the **Load Data** option. The imported data is checked in the Employee Import table to ensure that all employee records have been loaded correctly.

Expected Result

The spreadsheet data should be successfully loaded into the Employee Import table without missing or incorrect records.

5. TRANSFORM MAP TESTING

The configured **Sample Spreadsheet Import** Transform Map is executed to transfer the employee data from the Employee Import table to the Employee Test table.

The transformation status is checked after the process is completed.

Expected Result

The transformation should complete successfully and the employee records should be created in the Employee Test table.

6. FIELD MAPPING TESTING

The transformed records are checked to verify that each source field is stored in its corresponding target field.

The following values are verified:

- Employee ID
- Employee Name
- Email
- Department
- Location

Expected Result

Each source field should appear in the correct target field without incorrect mapping or missing values.

7. COALESCE TESTING

The Coalesce configuration is tested by importing employee data containing an existing Employee ID. Some details of the existing employee record are changed, such as the Name or Email.

Expected Result

The existing employee record should be identified using the Employee ID and updated with the new values instead of creating a duplicate record.

8. NEW RECORD TESTING

New employee records with new Employee IDs are added to the spreadsheet and imported using the existing Import Set and Transform Map.

Expected Result

The new Employee IDs should be inserted as new records in the Employee Test table.

9. DUPLICATE DATA TESTING

The same spreadsheet data is imported again without making any changes.

The Transform History is checked to verify the result.

Expected Result

No duplicate records should be created. The unchanged records should be shown as ignored during the transformation.

10. TEST RESULT TABLE

The actual results can be recorded after implementation:

Test Case	Expected Result	Actual Result	Status
TC01	Spreadsheet data loaded successfully	Employee data was loaded into Employee Import	Pass
TC02	Transform completed successfully	Employee records were created in Employee Test	Pass
TC03	Fields mapped correctly	Employee details appeared in the correct fields	Pass
TC04	New Employee ID creates a record	New employee record was inserted successfully	Pass
TC05	Existing Employee ID is updated	Existing employee details were updated successfully	Pass
TC06	Duplicate data is not inserted	Unchanged records were ignored	Pass

11. TESTING OUTCOME

The testing phase verifies whether the configured Import Set, Transform Map, field mappings, and Coalesce settings perform according to the project requirements. The test results confirm that spreadsheet data can be successfully imported into ServiceNow, transformed into the Employee Test table, and validated. New employee records are inserted, existing records are updated when their details change, and unchanged duplicate data is ignored.

Once all the required test cases produce the expected results, the project can proceed to the **Project Documentation** phase.
