

PHASE 8 – PROJECT DEMONSTRATION

1.INTRODUCTION

The Project Demonstration phase presents the practical working of the **Import Data using Transform Maps (Spreadsheets)** project. The demonstration is carried out using the completed ServiceNow implementation. It shows the prepared source spreadsheet, staging table (u_institution_details_import), Transform Map mapping configuration, Coalesce rule evaluation, import set logs, and the target u_institution_details table populated with imported records. A screen-recording video is used as the primary demonstration evidence.

2. DEMONSTRATION OBJECTIVES

The main objectives of the demonstration are:

- To demonstrate the completed ServiceNow data import project.
- To show the source Excel / CSV data file.
- To demonstrate loading data into the staging table (u_institution_details_import).
- To demonstrate the field mapping and mapping assist in the Transform Map.
- To demonstrate reference field matching (Student Name, Faculty Name) to the sys_user table.
- To demonstrate choice field mapping for Branch (ECE, EEE, CSE).

- To demonstrate Coalesce execution for preventing duplicate record inserts.
- To demonstrate successful transform set execution with zero errors.
- To demonstrate target table population and record post-import ACL security verification.
- To present the final working result of the project.

3. DEMONSTRATION REQUIREMENTS

The following items are required for the demonstration:

- ServiceNow instance
- Administrator account (admin or import_transformer role)
- Sample source spreadsheet (.xlsx or .csv)
- Staging table (u_institution_details_import)
- Target table (Institution Details / u_institution_details)
- Configured Transform Map (Institution Details Transform Map)
- Coalesce rule configured on email
- Screen-recording software

4.DEMONSTRATION PROCEDURE

The demonstration is performed in the following sequence:

Step 1 – Open ServiceNow & Review Source File

The ServiceNow instance is opened, and the project source file containing student data with fields (Roll Number, Name, Faculty, Branch, Email, Phone, Description) is presented.

Step 2 – Demonstrate Staging Table Creation

Navigate to **System Import Sets > Load Data** and load the spreadsheet to generate the staging table (u_institution_details_import).

Step 3 – Demonstrate Transform Map & Field Mapping

Open the Institution Details Transform Map showing mapped fields:

- u_student_name → student_name (Reference - User)
- u_faculty_name → faculty_name (Reference - User)
- u_branch → branch (Choice: ECE, EEE, CSE)
- u_email → email (String, Coalesce = true)
- u_phone_number → phone_number (String)
- u_description → description (Multi-line String)

5. INSTITUTION DETAILS TABLE DEMONSTRATION

The target Institution Details table (u_institution_details) is displayed. The table structure contains:

- Student Roll Number
- Student Name
- Faculty Name
- Branch (ECE, EEE, CSE)
- Email
- Phone Number
- Description

6. DATA IMPORT & TRANSFORMATION DEMONSTRATION

- **Run Transform:**

Click **Run Transform** to execute the import set.

- **Import Set Log:**

Show the execution state as Complete with zero errors and all rows processed.

- **Data Verification:**

Open u_institution_details.list to show the newly inserted student records properly categorized across ECE, EEE, and CSE branches.

7. COALESCE & DUPLICATE HANDLING DEMONSTRATION

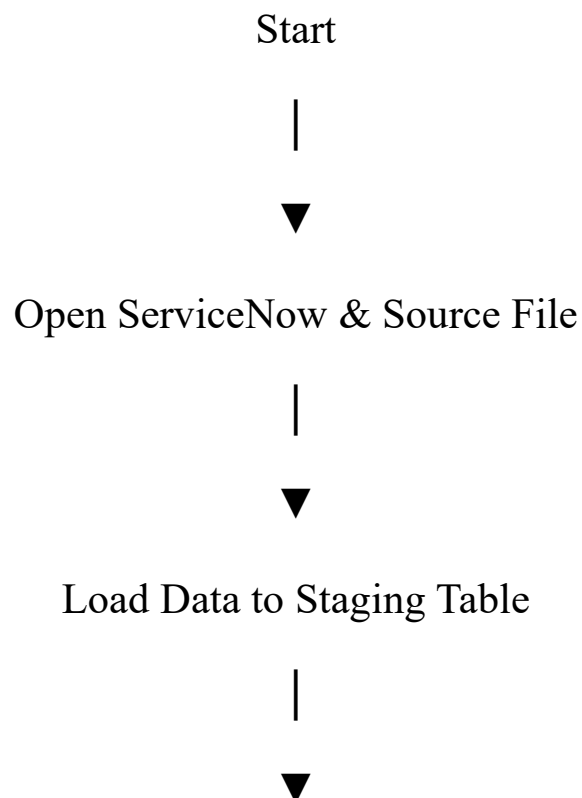

- Re-run the transform map using an updated source file containing identical email addresses but modified phone numbers.
- Demonstrate that ServiceNow updates the existing records instead of inserting duplicate rows, verifying the Coalesce functionality.

8.POST-IMPORT ACCESS SECURITY DEMONSTRATION

- Impersonate different role users (bb1, bb2, bb3, bb4, and admin) to confirm that imported records in u_institution_details are secured according to existing ACL policies.

9.COMPLETE DEMONSTRATION FLOW

The demonstration video follows the sequence below:

Show Transform Map & Field Mapping

Run Transform Set Execution

Demonstrate Target Table Population

Demonstrate Coalesce Duplicate Prevention

Verify Post-Import ACL Access

Show Final Result

End

10.DEMONSTRATION VIDEO

https://drive.google.com/file/d/1Byk4jprwq5_Yd9I2eZdTradyXOmL6Kii/view?usp=drive_link

The video demonstrates the complete working of the project, including:

- Data staging creation
- Transform map and field mapping configuration
- Reference and choice field resolution
- Coalesce rule evaluation
- Target table record population
- Post-import access control validation

11.DEMONSTRATION RESULT

The demonstration verifies the following behavior:

Operation	Demonstration Result
Data Staging	Raw file successfully imported into staging table (u_institution_details_import)
Field Mapping	Source fields accurately mapped to target table attributes

Operation	Demonstration Result
Reference/Choice Resolution	Reference fields map to sys_user and choice options match (ECE, EEE, CSE)
Coalesce Evaluation	Existing records updated without creating duplicate entries
Transform Execution	Import set status completed with zero errors
Post-Import ACL Security	Imported records governed accurately by target table ACLs

12. DEMONSTRATION EVIDENCE

The demonstration video is the primary evidence for Phase 8. No additional screenshots are required for this phase when the complete screen-recording clearly demonstrates all required operations. The video should be submitted along with the project documentation according to college submission requirements.

13.PROJECT OUTCOME

The demonstration successfully presents the completed ServiceNow Transform Map data import project. The project demonstrates:

- Bulk data import automation using spreadsheets.
- Staging table processing.
- Transform map field linkage and data transformation.
- Reference field and choice value mapping.
- Duplicate prevention via Coalesce configuration.
- Post-import security enforcement.

14.CONCLUSION

The Project Demonstration phase provides a practical presentation of the completed **Import Data using Transform Maps (Spreadsheets)** project. The screen-recording demonstrates the complete workflow of the system, from staging data loading and field mapping to record transformation and Coalesce verification. The demonstration confirms that the implemented ServiceNow Transform Map configuration imports spreadsheet data into the Institution Details table efficiently and accurately.
